

MADLearn

Enhancement and Integration Ideas

Product growth plan for MADLearn and the broader MAD Prospects universe

Document	Innovation roadmap
Application	MADLearn - AI-powered learning management for South African business teams
Prepared	26 May 2026

Built for the MAD Prospects universe: learning, assessment, progress evidence, admin insight, and MAD Cloud task validation.

1. North Star

MADLearn can grow from a training portal into the learning evidence layer of the MAD Prospects universe. Its strongest future role is not merely hosting lessons; it can prove capability, feed talent pipelines, personalize skills development, and connect learning activity to recruiting, content creation, lead generation, AI work, and customer success.

- * For learners, MADLearn should become a guided skill journey with practice, feedback, proof, and career momentum.
- * For businesses, it should become a measurable training operating system with cohorts, assignments, compliance evidence, and ROI reporting.
- * For the MAD ecosystem, it should become the central source of verified learning signals that other applications can use.

2. Product Foundation Enhancements

The first layer of enhancement should make current functionality more complete, easier to operate, and more scalable.

- * Course builder: add admin UI to create courses, modules, lessons, code examples, quizzes, passing scores, and publish status.
- * Draft and publish workflow: allow authors to save drafts, preview lessons, and publish only when content is ready.
- * Media support: attach videos, PDFs, images, slide decks, downloadable templates, and code files to lessons.
- * Lesson prerequisites: lock later lessons until earlier lessons, quizzes, or assignments are completed.
- * Cohorts and groups: organize learners by company, intake, department, project, or training program.
- * Enrollment management: assign courses to users, groups, or clients instead of relying only on visible course browsing.
- * Certificates: issue branded completion certificates with certificate ids and verification links.
- * Notifications: email, WhatsApp, Teams, or in-app reminders for new assignments, overdue modules, failed tests, and completion milestones.

3. Learning Experience Ideas

- * Personalized learning paths based on role, target skill, prior results, and career goals.
- * Adaptive remediation: if a learner fails a quiz, recommend specific lessons, examples, or micro-drills.
- * Practice labs with tasks, expected outputs, and rubric-based grading.
- * Inline notes and bookmarks so learners can save important lesson sections.
- * Discussion threads per lesson for cohort questions and instructor answers.
- * Office-hours scheduling tied to difficult modules or low quiz performance.
- * Gamification: streaks, badges, levels, cohort leaderboards, and progress celebrations.
- * Offline-friendly lesson packs for learners with unstable connectivity.
- * Mobile-first lesson summaries and short practice tasks.

4. Assessment and Evidence Enhancements

- * Question bank management with randomization, difficulty levels, tags, and version history.
- * Retake policies: lockouts, attempt limits, cooldowns, minimum study time, and best-score vs latest-score rules.
- * Answer explanations shown after submission to improve learning, not just scoring.
- * Assignment uploads for documents, screenshots, repositories, designs, or portfolio evidence.
- * Rubric-based grading for human or AI-assisted assessors.
- * Practical coding tests with automated checks, test cases, and scoring.
- * Oral or video evidence capture for sales, service, leadership, or interview training.
- * Assessment integrity: time limits, question shuffling, copy/paste controls, and suspicious behavior signals.
- * Evidence packs: export learner completion, scores, time spent, certificates, and submitted work as a PDF.

5. Admin and Business Intelligence Ideas

- * Cohort dashboards showing completion rate, average score, risk learners, and overdue assignments.
- * Course analytics showing hardest lessons, failed questions, drop-off points, and estimated learning time vs actual time.
- * Manager dashboards for department-level reporting.
- * Client dashboards for training delivered to external customers.
- * CSV, Excel, and PDF exports for HR, SETA, compliance, and management reporting.
- * Automated weekly training reports sent to managers.
- * Skills matrix: map courses and assessments to skills, then show learner and team skill coverage.
- * Intervention queue: automatically flag learners who are stuck, inactive, or repeatedly failing.

6. MAD Cloud Expansion

The current MAD Cloud feature already proves authenticated task submission and result rendering. It can become the compute and AI validation backbone for practical learning.

- * Real job queue: replace immediate local completion with queued tasks, worker assignment, retries, and logs.
- * Code validation workers: run learner code against tests and return pass/fail plus hints.
- * Document validation workers: check uploaded reports, CVs, proposals, or worksheets against rubrics.
- * AI marking workers: score free-text answers, summarize submissions, and suggest feedback for instructors.
- * Simulation workers: run sales-call, support-ticket, or project-management scenario evaluations.
- * Long-running jobs: allow status polling, progress percentages, and downloadable output artifacts.
- * Cost and usage tracking per learner, course, client, or tenant.

7. MAD Prospects Universe Integrations

Area	What it does	Who uses it
MADai	Use AI tutors, answer explanations, lesson summarization, personalized remediation, and assessment feedback.	AI-assisted learning

Area	What it does	Who uses it
MADAuthor	Create courses, lesson scripts, quizzes, rubrics, certificates, and training manuals from authoring workflows.	Content production
MADCreate	Generate visual assets, lesson graphics, thumbnails, worksheet layouts, and social learning content.	Learning media
MADHub	Centralize identity, app switching, tenant settings, notifications, billing, and workspace configuration.	Platform core
MADLeads	Trigger training for sales leads, onboarding sequences, partner education, and lead-nurture academies.	Revenue enablement
MADRecruiting	Use learning completions, quiz scores, and certificates as candidate signals and onboarding paths.	Talent pipeline
MADPulse	Measure learner sentiment, confidence, course satisfaction, and manager pulse checks.	Feedback analytics
MADLove	Connect customer success education, client onboarding, and community learning journeys.	Customer relationships
MADMultisciple	Provide multi-discipline academies and skill tracks across business functions.	Cross-functional training
MAD Cloud	Run validation, grading, generation, simulation, and evidence-pack assembly tasks.	Compute layer

8. Integration Patterns

The ecosystem should integrate through clear product events and shared identities rather than brittle point-to-point shortcuts.

- * Single sign-on: users should move across MAD apps without separate credentials.
- * Shared profile: one user profile should hold identity, company, role, skills, certificates, and preferences.
- * Event bus: MADLearn should emit events such as CourseAssigned, LessonCompleted, TestPassed, CertificateIssued, TaskCompleted, and LearnerAtRisk.
- * Universal notifications: all MAD apps should send messages through a shared notification service.
- * Shared file and artifact store: lesson attachments, submissions, certificates, generated assets, and reports should live in one governed storage model.
- * Common tenant model: businesses, clients, departments, cohorts, and projects should be reusable across apps.
- * API-first design: every major UI action should have a stable API that other MAD apps can call.

9. High-Impact Workflow Ideas

Recruiting to Learning

1. MADRecruiting identifies a promising candidate.
2. The recruiter assigns a MADLearn skills assessment.

3. MADLearn records test scores, practical submissions, and time taken.
4. MAD Cloud validates practical work.
5. MADRecruiting receives a candidate-readiness score and evidence pack.
6. If hired, the same learner account continues into onboarding courses.

Authoring to Delivery

1. MADAuthor drafts a course outline, lesson content, and quiz questions.
2. MADai improves explanations, examples, and assessment feedback.
3. MADCreate produces diagrams and thumbnails.
4. MADLearn imports the course as draft content.
5. An admin previews and publishes the course to selected cohorts.

Sales Enablement Academy

1. MADLeads identifies a campaign or product requiring sales enablement.
2. MADLearn assigns sales scripts, objection-handling lessons, and quizzes.
3. MADPulse collects confidence scores before and after training.
4. MADai runs practice roleplays and feedback.
5. Managers track readiness before campaign launch.

10. AI Tutor and Coach Ideas

- * Ask-a-question panel inside each lesson with answers grounded in that lesson and course.
- * Explain this code button for code examples.
- * Generate practice questions for the current lesson.
- * Summarize my weak areas after a failed quiz.
- * Create a personal revision plan for the week.
- * Instructor copilot that identifies common learner misunderstandings.
- * Admin copilot that explains dashboard trends and recommends interventions.

11. Multi-Tenant and Enterprise Readiness

- * Tenant-scoped data isolation for client organizations.
- * Company branding for logos, colors, certificates, and learner portals.
- * Manager and instructor roles distinct from platform admins.
- * Audit logs for user changes, course publishing, assessment edits, and admin access.
- * Data retention policies for learner records and evidence packs.
- * Billing and plan limits tied to active learners, courses, storage, and MAD Cloud usage.
- * Configurable CORS, domains, and app links per tenant.

12. Content and Course Ideas

- * Full-stack developer bootcamp expansion: Angular, .NET, SQL Server, DevOps, testing, cloud deployment, security, and portfolio projects.

- * Sales academy: prospecting, discovery, objection handling, proposals, follow-up, CRM hygiene, and closing.
- * Recruiter academy: sourcing, screening, interviewing, compliance, client communication, and placement operations.
- * AI productivity academy: prompt writing, workflow automation, data handling, quality control, and responsible AI.
- * Customer success academy: onboarding, account management, support handling, escalation, QBRs, and retention.
- * Leadership academy: feedback, coaching, goal-setting, performance conversations, and change management.

13. Recommended Roadmap

Area	What it does	Who uses it
Phase 1	Course authoring, cohort assignment, certificates, exports, improved admin filters, and stable frontend build/deploy pipeline.	Make the core LMS production-operable.
Phase 2	Question banks, retake policies, assignment uploads, rubrics, learner notifications, and manager dashboards.	Make training measurable and governable.
Phase 3	MADAuthor import, MADai tutor, MAD Cloud real workers, evidence packs, and MADRecruiting signals.	Make the MAD ecosystem connected.
Phase 4	Multi-tenant branding, SSO, billing, marketplace courses, partner academies, and advanced analytics.	Make the platform scalable as a business.

14. Prioritization Framework

Enhancements should be prioritized by value, dependency, and ecosystem leverage.

- * Do first: course authoring, cohort assignment, certificates, and reporting exports. These unlock real training operations.
- * Do next: assessment depth, rubrics, notifications, and manager dashboards. These improve outcomes and accountability.
- * Do alongside: build pipeline stability, observability, audit logs, and deployment automation. These reduce operational drag.
- * Do strategically: MADai tutor, MADAuthor import, MADRecruiting signals, and MAD Cloud workers. These create the ecosystem advantage.

15. Product Principles

- * Every lesson should produce evidence: time, completion, score, submission, certificate, or skill signal.
- * Every admin view should answer: who is learning, who is stuck, what is working, and what needs intervention.
- * Every integration should reuse identity, tenant, and event models rather than duplicating data.
- * AI should support learning quality, not hide weak content or unclear assessment design.
- * The MAD ecosystem should feel like one universe: one identity, one navigation pattern, one data backbone, many specialized apps.

16. Detailed Backlog Ideas

Course operations

- * Course templates for bootcamp, compliance, onboarding, product certification, and sales enablement formats.
- * Bulk import from Markdown, DOCX, PDF, Google Docs, Notion exports, Git repositories, or MADAuthor packages.
- * Lesson versioning so existing learner records remain tied to the content version they studied.
- * Content review workflow with draft, review, approved, published, archived, and retired states.
- * Course duplication and localization for industry, client, region, or role-specific variants.

Learner engagement

- * Learning calendar with scheduled modules, due dates, reminders, and catch-up windows.
- * Personal activity feed showing assigned courses, completed lessons, earned certificates, and feedback.
- * Smart nudges based on inactivity, repeated quiz failure, or approaching due dates.
- * Peer cohorts with discussion prompts, cohort milestones, and shared project submissions.
- * Learner portfolio profile that collects certificates, projects, badges, and assessment evidence.

Admin productivity

- * Bulk user upload and invite flows.
- * Role assignment and permission management.
- * Saved filters for cohorts, clients, departments, pass/fail status, and overdue work.
- * Report builder with selectable columns, date ranges, course filters, and export formats.
- * Automated interventions, such as emailing learners who fail a quiz twice or notifying managers when progress stalls.

17. Data Events for the MAD Universe

Area	What it does	Who uses it
UserRegistered	A new MADLearn account exists and can be linked to MADHub, MADRecruiting, or customer onboarding.	Identity sync
CourseAssigned	A learner or cohort has been assigned a learning path.	Notifications and manager reporting
LessonCompleted	A learner completed a lesson and accumulated time.	Progress evidence and skills matrix
TestSubmitted	A learner submitted an assessment with score and pass/fail result.	Recruiting and readiness signals
CertificateIssued	A learner completed the required pathway and received a verifiable credential.	Portfolio and compliance
LearnerAtRisk	A learner is inactive, overdue, or repeatedly failing.	Manager alerts and AI coaching
MadCloudTaskCompleted	A validation, grading, or generation task completed with output.	Artifact workflows

18. Integration Architecture Ideas

- * Use MADHub as the identity and tenant authority, with MADLearn consuming shared user, company, role, and subscription data.
- * Use an event bus or webhook service so apps receive learning events without direct database coupling.
- * Use a shared artifact service for uploaded assignments, generated certificates, assessment evidence, and MAD Cloud outputs.
- * Use a common notification service for email, WhatsApp, SMS, Teams, and in-app messages.
- * Use API keys or service-to-service JWTs for trusted calls between MAD applications.
- * Use common audit logging so actions across MADLearn, MADRecruiting, MADai, and MADHub can be reviewed together.

19. Commercial Packaging Ideas

Area	What it does	Who uses it
Starter Academy	Self-serve course hosting, basic progress, basic tests, and certificates for small teams.	Low-friction adoption
Team Training OS	Cohorts, assignments, manager dashboards, exports, notifications, and support.	Core business product
Recruiting Skills Lab	MADRecruiting integration, candidate tests, practical validation, and evidence packs.	Talent product
Client Enablement Portal	Branded training portals for agencies, SaaS vendors, and professional services firms.	Customer success product
AI Learning Studio	MADAuthor, MADai, MADCreate, and MADLearn bundled for course creation and delivery.	Creator product
Enterprise Compliance	Audit logs, SSO, tenant controls, retention, exports, and verified certificate records.	Enterprise product

20. Risks and Mitigations

Area	What it does	Who uses it
Content quality	AI-generated lessons may be shallow or inaccurate.	Use review workflow, expert approval, versioning, and learner feedback loops.
Assessment integrity	Learners may guess, share answers, or outsource tasks.	Use randomized banks, practical tasks, rubrics, and suspicious activity signals.
Data fragmentation	Each MAD app may create its own user and tenant model.	Centralize identity, tenant, events, and artifacts through MADHub.
Operational complexity	More integrations can create support burden.	Start with event contracts, clear ownership, observability, and phased rollout.

Area	What it does	Who uses it
Privacy	Learning data can become sensitive HR data.	Add consent, retention, audit logs, role-based access, and export/delete policies.

21. Suggested First 90 Days

1. Stabilize the frontend build and deployment pipeline so lazy chunks are always complete.
2. Build course authoring for courses, modules, lessons, quizzes, and publish status.
3. Add cohort assignment, learner invites, and admin enrollment management.
4. Add certificate generation and exportable learner evidence packs.
5. Add manager-ready CSV/PDF reports for completion, scores, time, and pass rate.
6. Define MADHub identity and tenant integration contracts.
7. Define MADLearn event names and payloads for the wider MAD ecosystem.
8. Upgrade MAD Cloud from local completion stub to queued task orchestration for at least one real validation use case.
